

Inundation products derived from remote sensing data for Lake Warden, Lake Gore wetlands and neighbouring systems in the South west Region and the rest of the State.

Metrics for inundation extents for selected wetlands in the South Coast region were required for multi year periods coinciding with waterbird surveys. These metrics will be added to models to further understand and perhaps explain bird densities. Similar metrics for a further 51 wetlands across the State were also calculated to further the understanding of bird absences when local conditions seem suitable.
